June 28, 2024

1. (a) Let $g(x) = x^3$. Then g is monotonically increasing on (0,1). We get

$$g^{-1}(y) = y^{1/3} \implies \frac{d}{dy}g^{-1}(y) = \frac{1}{3u^{2/3}}.$$

Since $X \in (0,1), Y = X^3 \in (0,1)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$
$$= 42(y^{1/3})^5 (1 - y^{1/3}) \cdot \frac{1}{3y^{2/3}}$$
$$= 14y(1 - y^{1/3}), \ y \in (0, 1).$$

We also have

$$\int_0^1 14y(1-y^{1/3}) \ dy = 14 \int_0^1 y - y^{4/3} \ dy$$
$$= 14 \left[\frac{1}{2} y^2 - \frac{3}{7} y^{7/3} \right]_0^1$$
$$= 14 \left(\frac{1}{2} - \frac{3}{7} \right)$$
$$= 1.$$

(b) Let g(x) = 4x + 3. Then g is monotonically increasing on $(0, \infty)$. We get

$$g^{-1}(y) = \frac{y-3}{4} \implies \frac{d}{dy}g^{-1}(y) = \frac{1}{4}.$$

Since $X \in (0, \infty)$, $Y = 4X + 3 \in (3, \infty)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$
$$= 7e^{-7 \cdot \frac{y-3}{4}} \cdot \frac{1}{4}$$
$$= \frac{7}{4} e^{\frac{21}{4} - \frac{7}{4}y}, \ y \in (3, \infty).$$

We also have

$$\int_{3}^{\infty} \frac{7}{4} e^{\frac{21}{4} - \frac{7}{4}y} dy = \frac{7}{4} e^{\frac{21}{4}} \int_{3}^{\infty} e^{-\frac{7}{4}y} dy$$
$$= \frac{7}{4} e^{\frac{21}{4}} \left[-\frac{4}{7} e^{-\frac{7}{4}y} \right]_{3}^{\infty}$$
$$= \frac{7}{4} e^{\frac{21}{4}} (\frac{4}{7} e^{-\frac{21}{4}})$$
$$= 1.$$

(c) Let $g(x) = x^2$. Then g is monotonically increasing on (0,1). We get

$$g^{-1}(y) = \sqrt{y} \implies \frac{d}{dy}g^{-1}(y) = \frac{1}{2\sqrt{y}}.$$

Since $X \in (0,1), Y = X^2 \in (0,1)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$
$$= 30y(1 - \sqrt{y})^2 \cdot \frac{1}{2\sqrt{y}}$$
$$= 15\sqrt{y}(1 - \sqrt{y})^2, \ y \in (0, 1).$$

We also have

$$\int_0^1 15\sqrt{y}(1-\sqrt{y})^2 dy = 15 \int_0^1 \sqrt{y} - 2y + y^{3/2} dy$$
$$= 15 \left[\frac{2}{3}y^{3/2} - y^2 + \frac{2}{5}y^{5/2} \right]_0^1$$
$$= 15(\frac{2}{3} - 1 + \frac{2}{5})$$
$$= 1.$$

2. (a) Let $g(x) = x^2$. Then g is monotonically increasing on (0,1). We get

$$g^{-1}(y) = \sqrt{y} \implies \frac{d}{dy}g^{-1}(y) = \frac{1}{2\sqrt{y}}.$$

Since $X \in (0,1), Y = X^2 \in (0,1)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$
$$= 1 \cdot \frac{1}{2\sqrt{y}}$$
$$= \frac{1}{2\sqrt{y}}, \ y \in (0, 1).$$

(b) Let $g(x) = -\log x$. Then g is monotonically decreasing on (0,1). We get

$$g^{-1}(y) = e^{-y} \implies \frac{d}{dy}g^{-1}(y) = -e^{-y}.$$

Since $X \in (0,1), \ Y = \log X \in (0,\infty)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$

$$= \frac{(n+m+1)!}{n!m!} e^{-ny} (1-e^{-y})^m \cdot |-e^{-y}|$$

$$= \frac{(n+m+1)!}{n!m!} e^{-y(n+1)} (1-e^{-y})^m, \ y \in (0,\infty).$$

(c) Let $g(x) = e^x$. Then g is monotonically increasing on $(0, \infty)$. We get

$$g^{-1}(y) = \ln y \implies \frac{d}{dy}g^{-1}(y) = \frac{1}{y}.$$

Since $X \in (0, \infty), Y = e^X \in (0, \infty)$. Then by Theorem 2.1.5,

$$f_Y(y) = f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$$

$$= \frac{1}{\sigma^2} \ln y e^{-(\ln y/\sigma)^2/2} \cdot \frac{1}{y}$$

$$= \frac{1}{\sigma^2} \frac{\ln y}{y} e^{-(\ln y/\sigma)^2/2}, \ y \in (0, \infty).$$

3. First of all,

$$X \in \{0, 1, 2, \ldots\} \implies Y \in \left\{0, \frac{1}{2}, \frac{2}{3}, \ldots\right\}.$$

Then

$$P(Y = y) = P(\frac{X}{X+1} = y)$$

$$= P(1 - \frac{1}{X+1} = y)$$

$$= P(X = \frac{y}{1-y})$$

$$= \frac{1}{3} \left(\frac{2}{3}\right)^{y/(1-y)}, \ y \in \left\{\frac{k}{k+1} : k \in \mathbb{N}_0\right\}.$$
